

Carbon Footprint of Wood Products & Buildings March 2022 | Kate Carrigg | Technical Director, WoodWorks

"The Wood Products Council" is a Registered Provider with The American Institute of Architects Continuing Education Systems (AIA/CES), Provider #G516.

Credit(s) earned on completion of this course will be reported to AIA CES for AIA members. Certificates of Completion for both AIA members and non-AIA members are available upon request. This course is registered with AIA CES for continuing professional education. As such, it does not include content that may be deemed or construed to be an approval or endorsement by the AIA of any material of construction or any method or manner of handling, using, distributing, or dealing in any material or product.

Questions related to specific materials, methods, and services will be addressed at the conclusion of this presentation.

Course Description

Issues surrounding carbon are in the forefront of many building designers' minds. As a result, questions can arise as to what building products should be specified to help achieve a more sustainable structure. This course takes a brief look at the use of wood in construction and highlights some of the positive environmental benefits that it can bring to the building. Basic terminology surrounding carbon will be reviewed along with information on carbon sequestration in wood. Case studies showing the benefits of wood will be presented along with a short survey of carbon policy around the U.S.

Learning Objectives

- 1. Review carbon basics and how material choice is related to sustainability.
- 2. Learn how wood products can be beneficial for the environment.
- 3. Understand carbon storage in wood products.
- 4. Evaluate case studies highlighting the benefits of wood construction.

Climate Change Background

Rising Temperatures and Melting Glaciers

From Rising Waters to Catastrophic Wildfires

Carbon & Greenhouse Gas Emissions

CO₂ in the atmosphere and annual emissions (1750-2019)

NOAA Climate.gov Data: NOAA, ETHZ, Our World in Data

Measuring Greenhouse Gases

Global Warming Potential (GWP) was developed to allow comparisons of the global warming impacts of different gases. Specifically, it is a measure of how much energy the emissions of 1 ton of a gas will absorb over a given period of time, relative to the emissions of 1 ton of carbon dioxide (CO_2). The time period usually used for GWP's is 100 years. (EPA)

	GWP
Carbon Dioxide (CO ₂)	1
Methane (CH ₄)	28-36
Nitrous Oxide (N ₂ O)	265-298
Fluorinated Gases	Thousands to Tens of Thousands

Carbon Dioxide Equivalents (CO_{2eq}) = International standard practice is to express greenhouse gases in terms of CO_2 equivalents

US Climate Policy

In the absence of strong Federal Policy, states and municipalities have adopted their own regulations

- Buy Clean California first US law to address embodied carbon in construction materials
 - GWP must not exceed set limits
 - Currently targets structural steel, steel rebar, glass, and mineral wool

Federal Policy is advancing under the Biden Administration:

- Rejoining the Paris Agreement
- Several first-week executive actions aimed at advancing zero-carbon technologies, increasing reforestation and carbon sequestration

Global Population Increase

2050 = 9.9 billion people

2020 = 7.8 billion people

Source: www.prb.org

To stay within 1.5°C warming, greenhouse gas emissions need to decline 45% below 2010 levels by 2030 and reach net zero emissions by 2050.

The built environment accounts for 40% of GHG emissions. Our sector has a critical role to play.

Carbon Terms

- **Embodied Carbon**: Carbon emissions associated with the entire life cycle of the building including harvesting, mining, manufacturing, transporting, installing, maintaining, decommissioning, and disposing/reuse of a material or product
- **Operational Carbon**: Carbon emissions associated with operating a building including power, heat, and cooling

Image: Boston Society for Architecture

Embodied Carbon

- Primarily related to manufacturing of materials
- More significant than many people realize, has been historically overlooked
- Big upfront GHG "cost" which makes it a **good near-term target** for climate change mitigation

Embodied vs. Operational Energy Traditional Non-Wood Building

% Energy

Image: Gray Organschi Architecture

How Does Wood Fit in?

Without decisive action, building materials used in new construction in cities across the globe will generate 100 gigatons of embodied carbon by 2050.

Source: <u>Carbon Neutral Cities Alliance</u>, <u>How much is a ton of carbon dioxide?</u>

48,300ft 100 Gigatons of CO₂ Equivalent to the volume of "329 Mt. Hoods Mt. Hood | Oregon 7,707ft (prominence)

Harvested Wood Products

- Solid sawn wood products have the lowest level of embodied energy.
- Wood products requiring more processing steps (for example, plywood, engineered wood products, flake-based products) require more energy to produce but still require significantly less energy than their non-wood counterparts.

Image: Weyerhaeuser

Image: LP Building Solutions

Image: Structurecraft

Image: Georgia-Pacific

Of the three primary structural materials used in construction, manufacturing lumber is the least energy intensive, followed by 100% recycled steel, concrete, and virgin steel. This accounts for wood's low embodied carbon.

Net Carbon Emissions Per Production Ton

More Carbon Terms

Carbon Sequestration: The process by which CO_2 is **removed** from the atmosphere and deposited in solid or liquid form in oceans, living organisms, or land.

Carbon Storage: Carbon is **stored as a solid** in the form of plant material: roots, trunks, branches, stems, and leaves. It can continue to be stored in **wood building materials**.

Carbon Benefits of Wood

- Less energy intensive to manufacture than steel or concrete
- Less fossil fuel consumed
 during manufacture
- Reduce process emissions
- Carbon storage in forests
 and promote forest health
- Extended carbon storage in products

Carbon Cycle Renewable Resource | Carbon Sequestration

Where is Carbon Stored?

Harvested Wood Pools

- Wood Products
- Solid Waste Disposal Sites

Forest Pools

- Aboveground Biomass
- Belowground Biomass
- Dead Wood
- Litter or Forest Floor
- Soil Organic Carbon

Carbon Storage in Harvested Wood Products

As of 2020, the carbon stock for Harvested **Wood Products in Use** in the conterminous 48 states and Alaska is estimated at **1,532 Million Metric Tons**.

Carbon Stocks in Forest Land and Harvest Wood Pools, 2020

https://www.epa.gov/sites/production/files/2021-04/documents/us-ghg-inventory-2021-main-text.pdf

Carbon Storage Wood ≈ 50% Carbon (dry weight)

Carbon vs CO₂

1 ton Carbon \neq 1 ton CO₂

1 ton Carbon = (44/12=) **<u>3.67</u>** tons CO₂

Using life cycle analysis, researchers found that substituting wood for concrete and steel in commercial buildings cut GHG emissions by an average of 60%.

Source: Use of structural wood in commercial buildings reduces greenhouse gas emissions, Oregon State University, 2017.

Tools to Evaluate Carbon Impact

Whole Building Life Cycle Assessment (WBLCA)

"Evaluation of the inputs, outputs, and potential environmental impacts... throughout its life cycle"

- WBLCA covers all stages in the life cycle of a building and its components
- Several tools available; various methodologies
- <u>https://www.thinkwood.com/education/calculate-</u> wood-carbon-footprint
- <u>https://www.thinkwood.com/blog/understanding-</u> <u>the-role-of-embodied-carbon-in-climate-smart-</u> <u>buildings</u>

WoodWorks Carbon Calculator

- Available at woodworks.org
- Estimates total wood mass in a building
- Provides **estimated** carbon impacts:
 - Amount of **carbon stored** in wood
 - Amount of greenhouse gas emissions avoided by choosing wood over a non-wood material

Volume of wood used: 208,320 cubic feet

Carbon stored in the wood: 4,466 metric tons of CO₂

Avoided greenhouse gas emissions: 9,492 metric tons of CO₂

TOTAL POTENTIAL CARBON BENEFIT: 13,958 metric tons of CO₂

EQUIVALENT TO:

2,666 cars off the road for a year

Energy to operate a home for 1,186 years

Case Studies

Bullitt Center Seattle, WA

Architect: The Miller Hull Partnership Structural Engineer: DCI Engineers

IV (HT)

- Designed for a 250-year life span
- Met criteria for Living Building Challenge 2.0
- Rooftop photovoltaic cells generate electricity for the building; building recycles its own water
- 6 over 2 design; 52,000 sf
- Heavy timber frame: glulam and NLT panels

Bullitt Center Seattle, WA

Volume of wood used: 24,526 cubic feet

U.S. and Canadian forests grow this much wood in: 2 minutes

Carbon stored in the wood: 545 metric tons of CO₂

Avoided greenhouse gas emissions: 1,158 metric tons of CO₂

TOTAL POTENTIAL CARBON BENEFIT: 1,703 metric tons of CO₂

EQUIVALENT TO:

Source:

325 cars off the road for a year

Energy to operate a home for 145 years

Volume of wood: Based on user inputs

Volume of Wood \rightarrow Volume of Logs \rightarrow Volume of Trees \rightarrow Tree Growth Rate

Volume of Wood \rightarrow Mass of Wood \rightarrow Mass of Carbon (50% of wood) \rightarrow Mass of CO₂ (3.67 x mass of Carbon)

Bullitt Center Seattle, WA

Volume of wood used: 24,526 cubic feet

U.S. and Canadian forests grow this much wood in: 2 minutes

Carbon stored in the wood: 545 metric tons of CO₂

Avoided greenhouse gas emissions: -1,158 metric tons of CO₂

TOTAL POTENTIAL CARBON BENEFIT: -1,703 metric tons of CO₂

EQUIVALENT TO:

325 cars off the road for a year-

Energy to operate a home for 145 years

Emissions avoided by choosing wood over alternative building material based on building type

Total Potential Carbon Benefit = Carbon Stored + Emissions Avoided

Convert Total Potential Carbon Benefit to laypersons' terms like emissions from operating a car or a home

1430 Q Sacramento, CA

III-A

- 6 stories of wood + mezzanine over 2-story concrete podium (IIIA over IA)
- 63,000 square feet
- First of its kind in USA
- Needed 6 floors of residential units to make the project viable
- Concrete and steel were too
 expensive

Architect: HRGA, The HR Group Architects Structural Engineer: Buehler

1430 Q Sacramento, CA

1430 Q

Volume of wood products used: 1,708 cubic meters (60,334 cubic feet)

U.S. and Canadian forests grow this much wood in: 5 minutes

Carbon stored in the wood: 1,426 metric tons of CO₂

Avoided greenhouse gas emissions: 3,031 metric tons of CO₂

US EPA

TOTAL POTENTIAL CARBON BENEFIT: 4,457 metric tons of CO₂

EQUIVALENT TO:

942 cars off the road for a year

Energy to operate 471 homes for a year

Estimated by the Wood Carbon Calculator for Buildings, based on research by Sarthre, R. and J. O'Connor, 2010, A Synthesis of Research on Wood Products and Greenhouse Gas Impacts, FPInnovations. Note: CO₂ on this chart refers to CO₂ equivalent.
